

EVEglyphDesign — Global Compliance Framework Assessment

EgD-GCF-001 · Vendor AI proposal scoring workbook

What this is	A working instrument for scoring a vendor's AI proposal against the eight structural-dependency domains of the EgD Global Compliance Framework (EgD-GCF-001). It is designed to be completed by a consultant, sitting with the proposal and the draft contract, before the client signs.
How to use it	1. Read the 'Domain detail' sheet and put the listed questions to the vendor in writing. 2. Score each of the eight domains on the 'Scoring sheet' using the dropdown in the Score column. 3. Record the evidence for every score — a URL or a specific contract clause reference. 4. Answer the four veto questions on the 'Result' sheet, then read the verdict.
The evidence standard	2 — EVIDENCED. A contractual commitment or a testable artifact. A clause you can point to by number, or an export you have actually executed. 1 — ASSERTED. The vendor says so. Marketing copy, a security questionnaire answer, or a trust-centre page. A trust-centre page caps the score at 1, however comprehensive it appears. 0 — ABSENT. No commitment and no assertion, or the vendor declined to answer.
Evidence is mandatory	Every score must carry an entry in 'Evidence cited'. A score without a citation is not a score; it is an impression. Cite the URL, or the clause number and the agreement it sits in (e.g. 'MSA §7.3', 'DPA Annex II').
Reading the result	The 'Result' sheet totals the eight domains out of 16 and returns a verdict band. Four veto conditions sit above the total. Any one of them returns DECLINE regardless of the score, because no amount of strength elsewhere compensates for a structural loss of control.
Not legal advice	This is a decision-support instrument. It does not constitute legal advice and does not substitute for review by qualified counsel in the relevant jurisdictions. The scores record what the consultant found; the decision remains the client's.
Licence	May be used with clients unmodified, with attribution to EVEglyphDesign. May not be rebranded.

Scoring sheet

Score each domain 0 / 1 / 2. Every score requires a cited URL or contract clause.

Domain ID	Control domain	What evidenced (2) looks like	Score (0/1/2)	Evidence cited (URL or clause)	Notes
SD-1	Derived-data title	Who owns embeddings, fine-tunes and extracted structure derived from the customer's data. Evidenced = the contract assigns title in derived artifacts to the customer.	2		
SD-2	Purpose limitation and training use	Whether customer data or derived artifacts train models beyond the customer's own tenant. Evidenced = a contractual prohibition, not a policy page.	2		
SD-3	Extractability	A complete, timestamped, full-text export the customer can execute without vendor assistance (the FTTE standard). Evidenced = a documented, tested export path.	2		
SD-4	Switching and functional equivalence	Switching assistance obligations, a transition window stated in days, and charges no greater than directly incurred cost.	2		
SD-5	Residency, transfer and lawful access	Where data rests AND where inference runs, plus the lawful-access exposure that follows from the answer.	2		
SD-6	Substrate and subprocessor transparency	Which model, running on whose infrastructure, and notice to the customer before that changes.	2		
SD-7	Access, logging and audit	Customer-exportable logs including vendor-personnel access, and an attestation whose scope actually covers the AI service rather than the surrounding platform.	2		
SD-8	Exit, deletion and survivability	Deletion that is verifiable, and an explicit statement of what survives termination.	2		

Total (calculated on the Result sheet)

16

Result

Computed from the scoring sheet. No manual entry below except the four veto answers.

Veto conditions	Yes / No	Why it vetoes
1. The vendor takes title to derived artifacts (embeddings, fine-tunes, extracted structure).	Yes	The customer's own data returns to it as someone else's asset.
2. The vendor holds unbounded rights to train on customer data.	No	Confidentiality and derived value both leave the tenant, irreversibly.
3. There is no independent extraction path the customer can execute alone.	No	Exit depends on the goodwill of the party being exited.
4. The inference jurisdiction is undisclosed.	No	Lawful-access exposure cannot be assessed at all, let alone accepted.

Total score (out of 16)	16	Sum of the eight domain scores. Maximum 16.
Domains still unscored	0	A verdict read while this is above zero is provisional.

Verdict	DECLINE — veto condition triggered
---------	------------------------------------

Verdict bands

14 - 16	Proceed
10 - 13	Proceed with conditions
6 - 9	Renegotiate before signature
0 - 5	Decline
Any veto = Yes	DECLINE — veto condition triggered (overrides the total)

Domain detail

The fuller description of each domain, with the questions to put to the vendor in writing.

SD-1 Derived-data title	
What the domain covers	Who owns the embeddings, fine-tunes, indexes and extracted structure derived from the customer's data. Raw data ownership is rarely contested; the derived layer is where title quietly transfers. Evidenced (2) means the contract assigns title in derived artifacts to the customer, by name.
Ask the vendor, in writing	1. Does the agreement assign title in embeddings, vector indexes, fine-tuned weights and extracted structure to us? Quote the clause. 2. If title does not pass to us, what licence do we hold in those artifacts, and does it survive termination? 3. Can we obtain the derived artifacts themselves on exit, or only the source data we supplied?

SD-2 Purpose limitation and training use	
What the domain covers	Whether customer data, or artifacts derived from it, are used to train, tune or evaluate models beyond the customer's own tenant. Evidenced (2) means a contractual prohibition. A policy page, however clearly written, is an assertion and caps at 1.
Ask the vendor, in writing	1. Is there a contractual prohibition — not a policy statement — on using our data or derived artifacts to train or tune any model outside our tenant? 2. Does that prohibition bind your subprocessors and your model providers, and how is it flowed down? 3. What is used for abuse monitoring or evaluation, who sees it, and for how long is it retained?

SD-3 Extractability	
What the domain covers	Whether the customer can obtain a complete, timestamped, full-text export it can execute without vendor assistance — the FTTE standard. Evidenced (2) means a documented export path that has actually been tested, not a support ticket you can raise.
Ask the vendor, in writing	1. Can we execute a complete full-text, timestamped export ourselves, without opening a ticket? Point us to the documentation. 2. What is in the export and what is left behind — attachments, metadata, audit history, derived artifacts? 3. Will you support a test export during the pilot, and will you contract to maintain that path?

SD-4 Switching and functional equivalence

What the domain covers	The obligations that apply when the customer leaves: switching assistance, a transition window stated in days, and charges no greater than the cost directly incurred by the vendor. Evidenced (2) means all three appear as obligations, with numbers.
Ask the vendor, in writing	1. What switching assistance are you obliged to provide, and over what transition window, stated in days? 2. Are switching charges limited to costs directly incurred by you? Show us the clause and the rate basis. 3. In what format is the data delivered, and is it usable by a competing service without bespoke conversion?

SD-5 Residency, transfer and lawful access

What the domain covers	Where data rests and — separately — where inference runs. The two answers often differ, and the second one determines the lawful-access exposure. Evidenced (2) means both are contractually fixed, with the transfer mechanism and access exposure named.
Ask the vendor, in writing	1. Name the jurisdictions where our data rests, and separately the jurisdictions where inference runs. 2. Which foreign lawful-access regimes could reach our data or our prompts as a result, and through which entity? 3. Are the residency commitments contractual and change-controlled, or configuration we could lose in an update?

SD-6 Substrate and subprocessor transparency

What the domain covers	Which model is running, on whose infrastructure, and what notice the customer receives before that changes. Evidenced (2) means the model and the hosting substrate are named, with a contractual notice period before substitution.
Ask the vendor, in writing	1. Name the model and version behind the service, and the infrastructure provider it runs on. 2. What notice do we receive before the model, the version or the substrate changes, and can we object? 3. Where is the current subprocessor list published, and are we notified of additions before they take effect?

SD-7 Access, logging and audit

What the domain covers	Whether the customer can export its own logs — including records of vendor-personnel access — and whether any third-party attestation genuinely covers the AI service rather than the surrounding platform. Evidenced (2) means exportable logs plus an attestation whose scope statement names the AI service.
Ask the vendor, in writing	1. Can we export our own access and activity logs, including every instance of vendor-personnel access to our tenant? 2. Show us the attestation's scope statement: does it name the AI service, or only the platform around it? 3. How are privileged vendor-side actions authorised, recorded and made visible to us in near real time?

SD-8 Exit, deletion and survivability

What the domain covers	Whether deletion is verifiable and what survives termination — backups, derived artifacts, aggregated statistics, model improvements. Evidenced (2) means a deletion obligation with a certificate or equivalent verification, and an explicit list of what persists.
Ask the vendor, in writing	1. On termination, what exactly is deleted, on what timetable, and do we receive a certificate of deletion? 2. What survives — backups, embeddings, fine-tunes, aggregate statistics, model improvements — and for how long? 3. How can we verify deletion independently rather than accepting your confirmation?
